

IT & SECURITY OPERATIONS

Internal Troubleshooting & IAM Guidelines

Identity & Access Management

Global VPN & Connectivity Failures (Error X-404)

This issue typically occurs due to a corrupted routing cache on the local machine when transitioning between home networks and public Wi-Fi. Employees experiencing a "VPN connection timed out" or terminal Error Code X-404 must disconnect from all active networks. Open the local terminal application and execute the command 'sudo route -n flush'. Following the cache flush, restart the local internet router, reopen the Cisco AnyConnect client, and authenticate using the secondary 2FA hardware token provided during onboarding.

Hardware Accessibility & Password Expiration (Error X-900)

Corporate security policy enforces strict password rotations every 90 days. If an account is locked due to expiration, the workstation will display Error Code X-900. The user must navigate to selfservice.nexuscorp.internal from an off-network mobile device. They must verify their identity via the SMS multi-factor authentication loop and establish a new 12-character alphanumeric password. Active Directory synchronization can take up to 15 minutes to propagate to local machines.

Software & Network Infrastructure

Software Provisioning & Licensing

Requests for specialized IDE licenses, Docker Desktop access, or cloud sandbox credentials require automated deployment. The employee must submit an active Jira ticket detailing the business justification, which must be approved by their department head. Once approved, the IT Service Desk automatically pushes the license package via the Jamf/Microsoft Intune portal within 2 hours. Manual installation attempts will trigger a compliance alert and lock the workstation.

Corporate Wi-Fi Certificate Expiration

When the internal network certificate expires, laptops will fail to join the 'Nexus-Secure' SSID. Users must open their network settings, 'Forget' the Nexus-Secure network, and temporarily connect to 'Nexus-Guest'. Once on the guest network, navigate to certs.nexuscorp.internal to download and execute the updated certificate installation package. A system reboot is required to finalize the network profile update.
